# Hands-on Lab: Improving Performance of Slow Queries in MySQL

Estimated time needed: 45 minutes

In this lab, you will learn how to improve the performance of your slow queries in MySQL, which can be particularly helpful with large databases.

## **Objectives**

After completing this lab, you will be able to:

- 1. Use the  $\ensuremath{\mathtt{EXPLAIN}}$  statement to check the performance of your query
- Add indexes to improve the performance of your query
   Apply other best practices such as using the UNION ALL clause to improve query performance

#### **Software Used in this Lab**

In this lab, you will use MySQL. MySQL is a Relational Database Management System (RDBMS) designed to efficiently store, manipulate, and retrieve data.

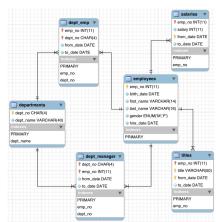

To complete this lab, you will utilize the MySQL relational database service available as part of the IBM Skills Network Labs (SN Labs) Cloud IDE. SN Labs is a virtual lab environment used in this course.

## **Database Used in this Lab**

The Employees database used in this lab comes from the following source: <a href="https://dev.mysql.com/doc/employee/en/">https://dev.mysql.com/doc/employee/en/</a> under the <a href="https://dev.mysql.com/doc/employee/en/">C BY-SA 3.0 License.</a>

The following entity relationship diagram (ERD) shows the schema of the Employees database:

The first row of each table is the table name, the rows with keys next to them indicate the primary keys, and the remaining rows are additional attributes.

## **Exercise 1: Load the Database**

Let's begin by retrieving the database and loading it so that it can be used.

1. In the menu bar, select Terminal > New Terminal. This will open the Terminal.

To download the zip file containing the database, copy and paste the following into the Terminal:

 $wget\ https://cf-courses-data.s3.us.cloud-object-storage.appdomain.cloud/IBM-DB0231EN-SkillsNetwork/datasets/employeesdb.zip$ 

2. Next, we'll need to unzip its contents. We can do that with the following command:

unzip emploveesdb.zip

```
theia@theiadocker-
                         :/home/project$ unzip employeesdb.zip
Archive: employeesdb.zip
  creating: employeesdb/
  creating: employeesdb/sakila/
  inflating: employeesdb/load_salaries2.dump
  inflating: employeesdb/test_versions.sh
  inflating: employeesdb/objects.sql
  inflating: employeesdb/load_salaries3.dump
  inflating: employeesdb/load_dept_emp.dump
  inflating: employeesdb/test_employees_sha.sql
  inflating: employeesdb/Changelog
  creating: employeesdb/images/
  inflating: employeesdb/employees_partitioned_5.1.sql
  inflating: employeesdb/test_employees_md5.sql
  inflating: employeesdb/README.md
  inflating: employeesdb/employees.sql
  inflating: employeesdb/load_titles.dump
  inflating: employeesdb/employees_partitioned.sql
  inflating: employeesdb/load_dept_manager.dump
  inflating: employeesdb/sql_test.sh
  inflating: employeesdb/load_departments.dump
  inflating: employeesdb/load_salaries1.dump
  inflating: employeesdb/show_elapsed.sql
  inflating: employeesdb/load_employees.dump
  inflating: employeesdb/sakila/README.md
  inflating: employeesdb/sakila/sakila-mv-data.sql
  inflating: employeesdb/sakila/sakila-mv-schema.sql
  inflating: employeesdb/images/employees.jpg
  inflating: employeesdb/images/employees.png
  inflating: employeesdb/images/employees.gif
                     :/home/project$ 🗌
theia@theiadocker-
```

3. Now, let's change directories so that we're able to access the files in the newly created **employeesdb** folder.

cd employeesdb

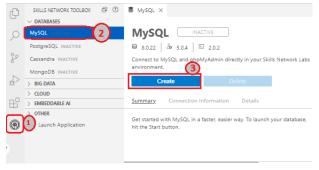

Check the line next to theia@theiadocker. If it reads /home/project/employeesdb, then you have successfully changed directories!

```
theia@theiadocker-
                         :/home/project$ unzip employeesdb.zip
Archive:
         employeesdb.zip
   creating: employeesdb/
   creating: employeesdb/sakila/
  inflating: employeesdb/load_salaries2.dump
  inflating: employeesdb/test_versions.sh
  inflating: employeesdb/objects.sql
  inflating: employeesdb/load_salaries3.dump
  inflating: employeesdb/load_dept_emp.dump
  inflating: employeesdb/test_employees_sha.sql
  inflating: employeesdb/Changelog
   creating: employeesdb/images/
  inflating: employeesdb/employees_partitioned_5.1.sql
  inflating: employeesdb/test_employees_md5.sql
  inflating: employeesdb/README.md
  inflating: employeesdb/employees.sql
  inflating: employeesdb/load_titles.dump
  inflating: employeesdb/employees_partitioned.sql
  inflating: employeesdb/load_dept_manager.dump
  inflating: employeesdb/sql_test.sh
  inflating: employeesdb/load_departments.dump
  inflating: employeesdb/load_salaries1.dump
  inflating: employeesdb/show_elapsed.sql
  inflating: employeesdb/load_employees.dump
  inflating: employeesdb/sakila/README.md
  inflating: employeesdb/sakila/sakila-mv-data.sql
  inflating: employeesdb/sakila/sakila-mv-schema.sql
  inflating: employeesdb/images/employees.jpg
  inflating: employeesdb/images/employees.png
  inflating: employeesdb/images/employees.gif
theia@theiadocker-
                         :/home/project$ cd employeesdb
theia@theiadocker-
                         :/home/project/employeesdb$
```

 ${\it 4. Start the MySQL service session using the {\it Start MySQL in IDE button directive}.}$ 

Open MySQL Page in IDE

5. On the launching page, click on the Create button.

6. With your password handy, we can now import the data. You can do this by entering the following into the Terminal:

```
mysql --host=mysql --port=3306 --user=root --password -t < employees.sql
```

When prompted, enter the password that was displayed under the Connection Information section when MySQL started up.

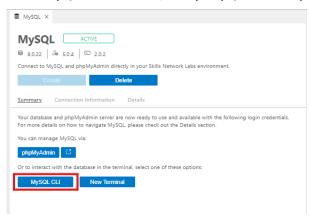

Please note, you won't be able to see your password when typing it in. Not to worry, this is expected!!

7. Your data will now load. This may take a minute or so.

When you've finished loading the data, you'll see the following:

This means that your data has been imported.

8. To enter the MySQL command-line interface, return to your MySQL tab and select MySQL CLI.

9. Recall that the name of the database that we're using is Employees. To access it, we can use this command:

use employees

```
mysql> use employees
Reading table information for completion of table and column names
You can turn off this feature to get a quicker startup with -A
Database changed
```

10. Let's see which tables are available in this database:

show tables;

In this database, there are 8 tables, which we can confirm with the database's ERD.

Now that your database is all set up, let's take a look at how we can check a query's performance!

# **Exercise 2: Check Your Query's Performance with EXPLAIN**

The EXPLAIN statement, which provides information about how MySQL executes your statement, will offer you insight about the number of rows your query is planning on looking through. This statement can be helpful when your query is running slow. For example, is it running slow because it's scanning the entire table each time?

1. Let's start with selecting all the data from the **employees** table:

SELECT \* FROM employees;

```
: /home/project/test_db-master_×
                                                                       1961-10-23

mysql> [													

Notice how EXPLAIN shows that it is examining 298,980 rows, almost the entire table! With a larger table, this could result in the query running slowly.

So, how can we make this query faster? That's where indexes come in!

## **Exercise 3: Add an Index to Your Table**

1. To begin, let's take at the existing indexes. We can do that by entering the following command:

Remember that indexes for primary keys are created automatically, as we can see above. An index has already been created for the primary key, emp\_no. If we think about this, this makes sense because each employee number is unique to the employee, with no NULL values.

2. Now, let's say we wanted to see all the information about employees who were hired on or after January 1, 2000. We can do that with the query:

SELECT \* FROM employees WHERE hire\_date >= '2000-01-01';

```
mysql> SELECT * FROM employees WHERE hire_date >=
                                                       '2000-01-01';
                                                       gender
            birth_date
                          first_name
                                         last_name
                                                                 hire date
  emp_no

                                                                 2000-01-23
  463807
            1964-06-12
                          Bikash
                                         Covnot
                                                       М
                                                                 2000-01-28
  499553
            1954-05-06
                          Hideyuki
                                         Delgrande
                                                       F
                                                                 2000-01-22
13 rows in set (0.17 sec)
```

As we can see, the 13 rows returned took about 0.17 seconds to execute. That may not seem like a long time with this table, but keep in mind that with larger tables, this time can vary greatly.

3. With the EXPLAIN statement, we can check how many rows this query is scanning:

EXPLAIN SELECT \* FROM employees WHERE hire\_date >= '2000-01-01';

```
mysql> EXPLAIN SELECT * FROM employees WHERE hire_date >=
                                                             '2000-01-01';
       select_type
                                   partitions
                                                       possible keys
                                                                                key_len
                      table
                                                type
                                                                        key
       SIMPLE
                     employees
                                  NULL
                                                ALL
                                                       NULL
                                                                        NULL
                                                                              I NULL
                                                                                          NUL
 row in set, 1 warning (0.01 sec)
mysql>
```

This query results in a scan of 299,423 rows, which is nearly the entire table!

By adding an index to the hire\_date column, we'll be able to reduce the query's need to search through every entry of the table, instead only searching through what it needs.

4. You can add an index with the following

```
CREATE INDEX hire_date_index ON employees(hire_date);
```

The CREATE INDEX command creates an index called hire\_date\_index on the table employees on column hire\_date.

```
mysql> CREATE INDEX hire_date_index ON employees(hire_date);
Query OK, 0 rows affected (0.82 sec)
Records: 0 Duplicates: 0 Warnings: 0
mysql> ■
```

5. To check your index, you can use the SHOW INDEX command:

SHOW INDEX FROM employees;

Now you can see that we have both the emp\_no index and hire\_date index.

```
mysql> SHOW INDEX FROM employees;
                                                                             Collation | Car
 Table
              Non_unique
                            Key_name
                                               Seq_in_index
                                                               Column_name
                            PRIMARY
                                                                             Α
 employees
                                                               emp_no
 employees
                            hire_date_index
                                                               hire_date
                                                                             Α
 rows in set (0.01 sec)
```

With the index added,

6. Once more, let's select all the employees who were hired on or after January 1, 2000.

SELECT \* FROM employees WHERE hire\_date >= '2000-01-01';

```
mysql> SELECT * FROM employees WHERE hire_date >=
                                                     '2000-01-01';
            birth_date | first_name
                                         last_name
                                                                hire_date
  emp_no
                                                      gender

  463807
            1964-06-12
                         Bikash
                                                                2000-01-28
                                         Covnot
                                                      М
13 rows in set (0.00 sec)
mysql>
```

The difference is quite evident! Rather than taking about 0.17 seconds to execute the query, it takes 0.00 seconds—almost no time at all.

7. We can use the EXPLAIN statement to see how many rows were scanned:

EXPLAIN SELECT \* FROM employees WHERE hire\_date >= '2000-01-01';

Under rows, we can see that only the necessary 13 columns were scanned, leading to the improved performance.

Under Extra, you can also see that it has been explicitly stated that the index was used, that index being hire\_date\_index based on the possible\_keys column.

Now, if you want to remove the index, enter the following into the Terminal:

```
DROP INDEX hire_date_index ON employees;
```

This will remove the hire\_date\_index on the employees table. You can check with the SHOW INDEX command to confirm:

```
mysql> DROP INDEX hire_date_index ON employees;
Query OK, 0 rows affected (0.02 sec)
Records: 0 Duplicates: 0
                          Warnings: 0
mysql> SHOW INDEX FROM employees;
  Table
                                                                     Collation
                                                                                 Cardinality
              Non_unique
                            Key_name
                                       Seq_in_index
                                                       Column_name
  employees
                       0
                            PRIMARY
                                                   1
                                                                     Α
                                                                                       299423
                                                       emp_no
  row in set (0.00 sec)
```

#### **Exercise 4: Use an UNION ALL Clause**

Sometimes, you might want to run a query using the OR operator with LIKE statements. In this case, using a UNION ALL clause can improve the speed of your query, particularly if the columns on both sides of the OR operator are indexed.

1. To start, let's run this query:

SELECT \* FROM employees WHERE first\_name LIKE 'C%' OR last\_name LIKE 'C%';

133310	1302 01 03	1 COT THA	0031101 011	- ı ·	1337 03 10					
499920	1953-07-18	Christ	Murtagh	M	1986-04-17					
499933	1957-10-21	Chuanti	Riesenhuber	į F	1993-05-28					
499936	1954-02-11	Chiranjit	Himler	j M	1994–10–31					
499947	1960-02-06	Conrado	Koyama	F	1989-02-19					
499948	1953-05-24	Cordelia	Paludetto	M	1993-01-28					
499956	1959-01-08	Zhonghua	Crooks	F	1994–10–12

499975	1952-11-09	Masali	Chorvat	M	1992-01-23					
499978	1960-03-29	Chiranjit	Kuzuoka	M	1990-05-24					
++		<del></del>	+	+	++					
28970 rows in set (0.20 sec)										

This query searches for first names or last names that start with "C". It returned 28,970 rows, taking about 0.20 seconds.

- 2. Check using the EXPLAIN command to see how many rows are being scanned!
- ► Hint (Click Here)
- ► Solution (Click Here)

Once more, we can see that almost all the rows are being scanned, so let's add indexes to both the first\_name and last\_name columns.

- 3. Try adding an index to both the first\_name and last\_name columns.
- ► Hint (Click Here)
- ► Solution (Click Here)
- 4. Great! With your indexes now in place, we can re-run the query:

SELECT \* FROM employees WHERE first\_name LIKE 'C%' OR last\_name LIKE 'C%';

499881	1952-12-01	Christoph	Schneeberger	F	1987–10–29

+			+	+	++					
28970 rows in set (0.16 sec)										

Let's also see how many rows are being scanned:

With indexes, the query still scans all the rows.

5. Let's use the UNION ALL clause to improve the performance of this query.

We can do this with the following:

SELECT \* FROM employees WHERE first\_name LIKE 'C%' UNION ALL SELECT \* FROM employees WHERE last\_name LIKE 'C%';

As we can see, this query only takes 0.11 seconds to execute, running faster than when we used the OR operator.

Using the EXPLAIN statement, we can see why that might be:

```
mysql> EXPLAIN SELECT * FROM employees WHERE first_name lIKE 'C%'
                                                                     UNION ALL SELECT * FROM
  id
       select_type
                      table
                                  partitions
                                                type
                                                         possible_keys
                                                                             key
   1
       PRIMARY
                                  NULL
                      employees
                                                         first_name_index
                                                                             first_name_index
                                                 range
   2
       UNION
                      employees
                                  NULL
                                                         last_name_index
                                                                             last_name_index
                                                 range
      in set, 1 warning (0.00 sec)
```

As the EXPLAIN statement reveals, there were two SELECT operations performed, with the total number of rows scanned sitting at 54,790. This is less than the original query that scanned the entire table and, as a result, the query performs faster.

Please note, if you choose to perform a leading wildcard search with an index, the entire table will still be scanned. You can see this yourself with the following query:

```
SELECT * FROM employees WHERE first_name LIKE '%C';
```

With this query, we want to find all the employees whose first names end with "C".

When checking with the EXPLAIN and SHOW INDEX statements, we can see that although we have an index on first\_name, the index is not used and results in a search of the entire table.

Under the EXPLAIN statement's possible\_keys column, we can see that this index has not been used as the entry is NULL.

498599   19	954-09-02 957-11-18 963-06-30	B   Marc		Fujisawa   Awdeh   Demeyer	1		F   M   M	1988-09-2   1986-07-2   1994-08-0		6-07-2	5 j	
tt												
mysql> EXPLAIN SELECT * FROM employees WHERE first_name LIKE '%C';												
id   select	table	pa	rtitions	type	pc	ossible_keys   k			key	key_len	ref	
1   SIMPLE	employees	NUI	-L	ALL	Νl	ULL   NULL			NULL	NULL	NULL	
1 row in set, 1 warning (0.00 sec)												
mysql> SHOW INDEX from employees;												
Table	ique   Key_ı	Key_name			Seq_in_index		Column_name		name	Collation	Card:	
employees   employees   employees	•	1   firs	PRIMARY   first_name_index     last_name_index		: :		emp_no     first_name     last_name			A A A	     	
3 rows in set (0.00 sec)												

On the other hand, indexes do work with trailing wildcards, as seen with the following query that finds all employees whose first names begin with "C":

SELECT \* FROM employees WHERE first\_name LIKE 'C%';

```
492080
           1961-08-02
                         Cullen
                                           Whittlesey
                                                                        1997-01-12
 495632
           1958-05-16
                         Cullen
                                           Pollock
                                                              М
                                                                        1992-01-21
11294 rows in set (0.04 sec)
mysql> EXPLAIN SELECT * FROM employees WHERE first name LIKE 'C%';
                                                        possible_keys
  id
       select_type
                     table
                                  partitions
                                                type
                                                                            key
       SIMPLE
                     employees
                                  NULL
                                                range
                                                       first_name_index | first_name_index
 row in set, 1 warning (0.01 sec)
```

Under the EXPLAIN statement's possible keys and Extra columns, we can see that the first name index is used. With only 20,622 rows scanned, the query performs better.

## **Exercise 5: Be SELECTive**

In general, it's best practice to only select the columns that you need. For example, if you wanted to see the names and hire dates of the various employees, you could show that with the following query:

SELECT \* FROM employees;

```
499998
           1956-09-05
                                           Breugel
                                                                         1993-10-13
                         Patricia
                                                               М
  499999
           1958-05-01
                                           Tsukuda
                                                               М
                                                                         1997-11-30
                         Sachin
300024 rows in set (0.26 sec)
mysql> EXPLAIN SELECT * FROM employees;
                                                                                key_len
                      table
                                  partitions
                                                type
                                                       possible_keys
                                                                        kev
                                                                                          ref
       select_type
       SIMPLE
                                  NULL
                                                ALL
                                                       NULL
                                                                        NULL I
                                                                                NULL
                                                                                          NULL
                     employees
 row in set, 1 warning (0.01 sec)
```

Notice how the query loads 300,024 rows in about 0.26 seconds. With the EXPLAIN statement, we can see that the entire table is being scanned, which makes sense because we are looking at all the entires.

If we, however, only wanted to see the names and hire dates, then we should select those columns:

SELECT first\_name, last\_name, hire\_date FROM employees;

```
Patricia
                                       1993-10-13
                   Breugel
  Sachin
                   Tsukuda
                                       1997-11-30
300024 rows in set (0.17 sec)
mysql> EXPLAIN SELECT first_name, last_name, hire_date FROM employees;
                      table
                                                type
                                                       possible_keys
                                                                        key
                                                                               key_len
                                                                                          ref
  id
       select_type
                                  partitions
       SIMPLE
                                I NULL
                                                ALL
                                                       NULL
                                                                        NULL | NULL
                                                                                         NULL
                     employees
 row in set, 1 warning (0.00 sec)
```

As you can see, this query was executed a little faster despite scanning the entire table as well.

Give this a try!

#### **Practice Exercise 1**

Let's take a look at the **salaries** table. What if we wanted to see how much each employee earns?

When running the query, keep in mind how long it takes the query to run and how many rows are scanned each time.

- 1. First, let's select all the rows and columns from this table.
- ► Hint (Click Here)
- ► Solution (Click Here)

2. Now, let's see if there's a way to optimize this query. Since we only want to see how much each employee earns, then we can just select a few columns instead of all of them. Which ones would you select?

▶ Hint (Click Here)▶ Solution (Click Here)

#### **Practice Exercise 2**

Let's take a look at the **titles** table. What if we wanted to see the employee and their corresponding title?

Practice by selecting only the necessary columns and run the query!

- ▶ Hint (Click Here)▶ Solution (Click Here)

## Conclusion

Congratulations! Now, not only can you now identify common causes to slow queries, but you can resolve them by applying the knowledge that you have gained in this lab. Equipped with this problem-solving skill, you will be able to improve your queries performance, even in large databases.
